Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Detecting granulocyte activation by detecting differential expression of genes associated with granulocyte activation, which serves as diagnostic markers that is useful for monitoring disease states and drug toxicity.

claim 1; SEQ ID NO 1043; 114pp; English.

The invention relates to detecting (MI) granulocyte (GC) activation (GCA), by detecting the level of expression of gene(s) (Gs) identified by NMA chip analysis a sgiven in the specification, and comparing the expression level to an expression level in an unactivated GC, where differential expression of Gs is indicative of GCA. Also included are

```
modulating (M2) GA by contacting GC with an agent that alters the expression of at least one gene in GS; (2) screening (M3) for an agent capable of modulating GCA or an inflammation (especially chronic) in a tissue, an allergic response in a subject, exposure of a subject to a pathogen or sterile inflammatory disease using the gene expression at tissue, an allergic response in a subject, exposure of a subject to a pathogen or sterile inflammatory disease, by detecting the level of expression in a sample of the tissue of gene(s) from GS, where the level of expression of the gene is indicative of inflammation; (4) treating of expression of the gene is indicative of inflammation with an employer, exposure of a subject to a pathogen or sterile inflammatory disease, by contacting a tissue, having inflammation with an agent that modulates the expression of gene(s) from GS in the tissue. M1 is useful for modulating GA, M3 is useful conflammatory disease, by contacting a tissue having inflammation of a uniflammation in a tissue, M4 is useful for detecting an inflammation (especially chronic) in a tissue, an allergic response in a subject, exposure of a subject to a pathogen or sterile inflammation of separation in a tissue, an allergic response in a subject, exposure of a subject to a pathogen or sterile inflammation disease (e.g. cardiac reperfusion injury, renal reperfusion injury, ARDS, adult conflammatory disease, ulceration of disease, ulceration of disease, ulceration of disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             360
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  480
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 540

The present invention describes an isolated epitope (1) and an epitope cluster. Also described is a vaccine or immunotherapeutic composition (VC) comprising (1). (1) has vaccine or immunotherapeutic composition treating an animal, by administering to an animal the vaccine or immunotherapeutic composition. VC is also useful for evaluating immunogenicity of a vaccine or immunotherapeutic composition. W is also useful for evaluating administering VC to an HLA-transgenic animal and evaluating immunogenicity based on a characteristic of the animal, or by in vitro primary stimulation of a T cell and evaluating immunogenicity. (1) is useful for determining specific T cell frequency, by contacting T cells with a MHC-peptide complex, and further comprises ELISPOT analysis, limiting dilution analysis, flow cytometry, in situ hybridisation and/or polymerase chain reaction (PCR). ABQ83843 to ABQ83858 and ABP74128 to ABP747;3 represent sequences used in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     09
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    9
                                                                                                                                                                                                                                                epitope; vaccine; immunotherapeutic; cytostatic; immunogenicity;

epitope cluster comprising the polypeptide. Also disclosed is a vaccine or immunotherapeutic composition containing an epitope of the invention. Compositions of the invention may be used in the treatment of cancer. The method can be combined with a radiation therapy, chemotherapy. blochemotherapy or surgery. The composition is also useful for evaluating immunogenicity of a vaccine or immunotherapeutic compound. Multimeric MHC -peptide complexes of the invention are useful for determining specific T call frequency. This method is useful for evaluating immunological response, by performing the method prior to and subsequent to an immunological immunisation step. Compositions of the invention are useful for diagnosing a disease. The current sequence represents an epitope of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This is the nucleotide sequence of a newly isolated human SSX4 cDNA clone. The cDNA was isolated from a human testicular cDNA by PCR amplification using primers (see AAV7006-63) based on the known SSX2 sequence. A SSX5 clone (see AAV70061) was also obtained. 2 Forms of SSX4 were identified. One of these lacked nucleotides 331-466 but was otherwise identical to the present SSX4 sequence and is described as an alternatively spliced form. SSX4 shares 89.4% homology to SSX1 on the nucleotide level and 79.3% at the amino acid level. The inventional additionally provides expression vectors, transformed or transfected cells that can be used to produce SSX proceins, and primers (see AAV70062-73) useful for determining expression of an SSX gene in a sample. The

The gene fusion is then transcribed to produce an SYT-SSX2 (AAT11781) fusion transcribt and translated into a fusion protein. SSX2 with Small and istinguished from related sequence SXX1 (AAT11779) by digestion with Smal and Lep1. Primer AAT11794 has been used in polymerase chain reaction amplification of SXX2 sequences. Detection of the gene or its product in an abnormal location or as a fusion may be used in diagnosis of synovial sarrowa, using primers, probes, humanised antibodies, may also be used therapeutically, and antitumour recombinant vaccines may be

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ò
```

The invention describes a method of treating genetically-defined disease associated with chromosomal aberrations yielding oncogenic fusion proteins (1), treating cancerous cells containing (1) in a heterogeneous cell population, treating proliferative diseases associated with mutant protein or cellular protein isoforms (II) dependent on heat shock protein (HSP)-90, or selectively treating cells expressing (II) involving administering HSP90-inhibitor. The method is useful for treating genetically-defined disease with foromosomal aberration yielding oncogenic fusion protein, treating cancerous cells containing fusion protein in theorogeneous cell population, treating proliferative disease (e.g. rhematoid atthritis or cancer) associated with mutant protein or cellular protein isoform dependent on heat shock protein or cellular protein isoform in patient heterozygous for (II). The method is useful for treating a disease e.g. haematopoletch disorder such as T or B cell lymphoma, chronic myeloid leukaemia (CML), ABL, AML, AML, AML, and CML, ó 120 240 211 180 271 92 argaacgagacgacgccrrrdcaaggagacccacggrrgcrgcrcaaaraccagagaag 151 craegrircaageccacecreecercrireargranaaaceceaagacriecag 331 Treating genetically-defined disease associated with chromosomal aberrations yielding oncogenic fusion proteins, e.g. cell proliferative diseases, involves administering an inhibitor of heat shock protein 90. or a disease characterised by a solid tumour such as papillary thyroid carcinoma, Bwing's sarcoma, melanoma, libosarcoma, rabdomyosarcoma and synovial sarcoma. The method is also useful for treating viral infections. This represents the DNA sequence of a chromosome aberration 1 ATGAACGGAGACGACGTTTGCAAGGAGACCCAGGGATGATGCTCAAATATCAGAGAG 152 Arccaragecerregargararreceaarracerreceaagegagagagagagarg AAATCCTCGGAGAAAATCGTCTATGTGTATGAAGCTAAACTATGAGGTCATGACTAAA AAAGCCTCGGAGAAAATCTTCTATGTGTATATGAAGAGAAAGTATGAGGCTATGACTAAA CTAGGTTTCAAGGTCACCTCCCACCTTTCATGCGTAGTAAACGGGCTGCAGACTTCCAC Gaps ; 0 Length 766; 766 BP; 229 A; 181 C; 200 G; 156 T; 0 U; 0 Other; Indels 49; DB 6; Query Match 86.2%; Score 496.6; DB 6; Best Local Similarity 91.5%; Pred. The method is useful for diagnosing, determining onset, progression, or regression of colon cancer in a subject, or for selecting a course of treatment of a subject having or suspected of having colon cancer. The colon cancer associated polypeptides are useful as markers for diagnosing colon cancer, and for following the course of treatment of colon cancer. The present sequence is human colon cancer-associated polypeptide gene

                                                                                                                                                                                                                                                   immunogenicity based on a characteristic of the animal, or by in vitro primary stimulation of a T cell and evaluating immunogenicity. (I) is useful for determining specific T cell frequency, by contacting T cells with a MHC-peptide complex, and further comprises ELISPOT analysis, limiting dilution analysis, flow cytomeerry, in situ hybridisation and/or polymerase chain reaction (PCR). ABD03843 to ABD038958 and ABP74128 to ABP74713 represent sequences used in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                            represent sequences used in the exemplification of the present
                                                                                                                                             The present invention describes an isolated epitope (I) and an epitope cluster. Also described is a vaccine or immunotherapeutic composition (VC) comprising (I). (I) has cytostatic activity. VC is useful for treating an animal, by administering to an animal the vaccine or immunotherapeutic composition. VC is also useful for evaluating immunogenicity of a vaccine or immunotherapeutic composition, by administering VC to an HLA-transgenic animal and evaluating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          CCCCCGGGAAATCCAAGTACCTTGGAGAAGATTAACAAGACATCTGGACCCAAAAGGGGG

The invention relates to an isolated epitope polypeptide that has high effinity for major histocompatibility complex (MHC) class I, and an epitope cluster comprising the polypeptide. Also disclosed is a vaccine or immunotherapeutic composition containing an epitope of the invention. Compositions of the invention may be used in the treatment of cancer. The method can be combined with a radiation therapy, chemcherapy or biochemotherapy or surgery. The composition is also useful for evaluating immunogenicity of a vaccine or immunotherapeutic compound. Multimeric MHC repeptide complexes of the invention are useful for determining specific T cell frequency. This method is useful for evaluating immunological response, by performing the method prior to and subsequent to an immunisation step. Compositions of the invention are useful for disease. The current sequence represents an epitope of the

Novel method of serological fishing - allows isolation of molecule antigens) associated with pathological conditions, e.g. Hodgkin's disease, cancer or auto:immune disease.
                                             Claim 31; Page 29; 44pp; English
     WPI; 1997-051896/05
```

designated HOM-MEL 40. It was isolated using a novel method in which a designated HOM-MEL 40. It was isolated using a novel method in which a cDNA library prepol from malignant melanoma and expressed in B. coli colls. Lysates of the host cells and with sera that had been treated to remove interfering binding partners. This involved contacting the sample with lysates of untransfected host cells and with host cells transformed with the same vector (phage lambda) used to make the CDNA library. The method, termed serological fishing, can be used to detect antigens in human tissues, esp. tumour cells, which are useful in the moliganosis of diseases and/or for immunotherapy and gene therapy of infectious, autoimmune and malignant diseases (see also AAA-4747-49). HOM-MEL 40 is expressed in 50% of melanomas, 20% of prostate cancers, 20% of gastric cancers, 20% of colorectal cancers, 12% of lung cancers and calls present a nonomer (see also AAW-09449- 52) derived from HOM-MEL, suggesting that HOM-MEL 40-specific vaccines, useful in inducing T lymphocytes, are possible

clone HOW-MEL-40 was isolated from a human malignant melanoma oDNA-
library using a method, designated serological fishing, designed to
cldentify immunoracity markers of disease. In this method, cells
contracteristic of a disease are used to prepare a cDNA library for
characteristic of a disease are used to prepare a cDNA library for
characteristic of eukaryotic or prokaryotic cells, and the cells grown to
creative with these cells, then the stripped sample is similarly treated
contracted with lysate of the library cells, so that specific components
incubated with lysate of the library cells, so that specific components
in the sample may bind to the expression protein. Proteins that form
complexes are identified as disease markers. In the case of HOM-
mEL-40, the new melanoma associated antigen is strongly expressed in
complexed antigon is strongly expressed in
complexed at the complexed antigon is strongly expressed in
complexed at the confident of the case of HOM-
melanoma, but not healthy tissues. The deduced amino acid sequence
conclusional fishing method was also used to identify a claimed
con marker (see AAV04262) of Hodgkin's disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Mucleic acid and derived protein are markers for Hodgkin's disease - used in identifying immuno:reactive markers of disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     1 ATGAACGGAGGCGACGCCTTTGCAAGGAGACCCAGGGATGATGCTCAAAATATCAGAGAAG

The present invention describes a method (MI) for screening for an antinoplastic agent. The method involves exposing cells to a chemical agent cobe tested for anti-neoplastic activity, determining a change in expression of at least one gene (I) of a signature gene set, where (I) comprises a sequence (S) selected from 8447 sequences (given in ABL61664 comprises in dicative of anti-neoplastic activity. (I) has cytostatic expression is indicative of anti-neoplastic activity. (I) has cytostatic activity and can be used in gene therapy. MI can be used for screening an enti-neoplastic agent, and can be used for producing a product which is anti-neoplastic agent, and can be used for producing a product which is comparate of the agent. MI can be used in the treatment of cancer such to properties of the agent. MI can be used in the treatment of cancer such as colon, breast, stomach, lung, thyroid, oesophageal, ovarian, kidney, prostate or pancreatic cancer, adenocarcinoma, carcinoma, clear cell carcinoma, neuroendocrine carcinoma, papillary carcinoma and Wilm's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Screening for anti-neoplastic agent involves exposing cells to a chemical agent to be tested for anti-neoplastic activity, and determining a change in expression of a gene of a signature gene set.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Horrigan

The present invention describes a method (M1) for screening for an antinoplastic agent. The method involves exposing cells to a chemical agent copplastic activity, determining a change in expression of at least one gene (1) of a signature gene set, where (1) comprises a sequence (S) selected from 8447 sequences (given in ABL61664 comprises in air least 95% identical to (S), where a change in comprises in indicative of anti-neoplastic activity. (I) has cytostatic activity and can be used in gene therapy. M1 can be used for screening an anti-neoplastic agent, and can be used for producing a product which is cantinoplastic agent. M1 can be used in the treatment of cancer such to make a set of M1, and the data is sufficient to convey the chemical structure and/or properties of the agent. M1 can be used in the treatment of cancer such as colon, breast, stomach, lung, thyroid, oesophageal, ovarian, kidney, prostate or pancreatic cancer, adenocarionem, carcinoma, clear cell carcinoma, neuroendocrine carcinoma, papillary carcinoma and Wilm's cell carcinoma, neuroendocrine carcinoma, papillary carcinoma and Wilm's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Screening for anti-neoplastic agent involves exposing cells to a chemical agent to be tested for anti-neoplastic activity, and determining a change in expression of a gene of a signature gene set.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            chagerricaaggecacecreceacerricargranamaacgggcgaagacricaag 338

                                                                                                                                                                                                                                                                                                                         ð
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to isolated polymucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed activity of (II) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (III). (II) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. polypeptide and polymucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. AAS64197-AAS94564 represent novel human diagnostic coding sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at fip.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     481 AAACAIGCCIGGACCCACAGACTGCGIGAGAAAGCAGCIGG--IGGITIAIGAAGAGA

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 17,

Patent No.. 5698396
GENERAL INFORMATION:
APPLICANT: Pfreundschuh, Michael
TITLE OF INVENTION: Method For Identifying Or Isolating A Molecule
TITLE OF INVENTION: And Molecules Identified Thereby
NUMBER OF SEQUENCES:
CORRESPONDENCE ADDRESS:
ADDRESSEE: Felfe & Lynch
STREET: 805 Third Avenue
CITY: New York City
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           kb storage

Patent No. 6017716
GENERAL INFORMATION:
APPLICANT: Pfreundschuh, Michael
TITLE OF INVENTION: Method For Identifying Or Isolating A Molecule
TITLE OF INVENTION: And Molecules Identified Thereby
NUMBER OF SEQUENCES: 4
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   541 AGCGACCCTGAGGAAGATGACGAGTAACTCCCCTC 575
